

Ranking Web of Universities (webometrics.info). January 2026 edition

Isidro F. Aguillo

Cybermetrics Lab (IPP-CSIC)

Madrid, Spain

isidro.aguillo@csic.es

Abstract

The Ranking Web (Webometrics) has been published since 2004 with the aim of promoting open access to the knowledge generated by universities. The January 2026 edition includes more than 32,000 higher education institutions (HEIs) from around the world. The ranking model is based on both webometric and bibliometric indicators, which are collected from reliable sources such as Majestic, OpenAlex, and Scimago-Scopus. Web data is gathered during the first days of January, while bibliometric information covers the period from 2020 to 2024 for Excellence and 2021-2025 for Openness. The results are historically consistent with those published by other ranking entities for top universities, but Webometrics provides data on many institutions from the Global South that are not covered by other rankings.

Keywords

University ranking; Webometrics; Bibliometrics; Ranking web; webometrics.info; Global South; higher education institutions; universities

Objectives and Motivation

In 2003, following the publication of the ground-breaking Academic Ranking of World Universities (ARWU) by Shanghai Jiao Tong University, we decided to adopt their key innovations: The ranking would be based on publicly available web data, combining variables into a composite indicator, and providing true global coverage. The first edition was published in 2004, and it has been released twice per year since 2006.

The Ranking Web is not a ranking of university websites, but a ranking of universities themselves. It uses both webometric (all missions) and bibliometric (research mission) indicators. We do not evaluate websites in terms of design, usability, or popularity based on visit numbers. Instead, web indicators are used as proxies to assess the university's global performance comprehensively, considering its activities, outputs, relevance, and impact.

The primary objective of the Ranking Web is to promote open access to the knowledge generated by universities. The best strategy for improving a university's rank is to increase the quantity and quality of its web content, which significantly enhances the transfer of scientific and cultural knowledge to society. To achieve this goal, the publication of rankings is one of the most powerful tools for initiating and consolidating change in academia, increasing scholars' engagement, and establishing long-term strategies.

Ultimately, a reliable ranking is only possible if a university's web presence accurately reflects its activities. In the second decade of the 21st century, the web is central to the future of all university missions, as it is already the most important scholarly communication tool, the future platform for off-campus distance learning, the open forum for community engagement, and the universal showcase for attracting talent, funding, and resources.

Webometrics has now entered its 22nd year of publication with the goal of offering full coverage of higher education institutions, regardless of the country or discipline. Currently, we rank 32,000 HEIs from over 200 countries. Webometrics is the largest academic ranking of higher education institutions, providing an independent, objective, free, and open scientific exercise every six months to offer reliable, multidimensional, updated, and useful information about the performance of HEIs worldwide.

We aim to motivate both institutions and scholars to maintain a web presence that accurately reflects their activities. If an institution's web performance is below the expected level given its academic excellence, university authorities should reconsider their web policies, promoting substantial increases in the volume and quality of their electronic publications.

Methodology

The editors of the Ranking Web are scientists working at a world-class public research institution with extensive experience in metrics-guided evaluation.

Webometrics publishes a unique ranking of universities in each edition. The combination of indicators results from careful investigation and is not open to individual selection by users without sufficient expertise in the field. Other publishers may produce a series of different rankings using the same data in various ways, which is confusing and unhelpful.

Research-only (bibliometric) rankings tend to be biased against disciplines such as technology, computer science, social sciences, and humanities, which usually account for more than half of the scholars and students in a standard comprehensive university. Webometrics also indirectly measures other missions, such as teaching or the so-called third mission, considering not only the scientific impact of university activities but also the economic relevance of technology transfer to industry, community engagement (social, cultural, environmental roles), and even political influence.

Webometrics uses link analysis for quality evaluation, a far more powerful tool than citation analysis or global surveys. In the first case, bibliometrics counts only formal recognition between peers, while links not only include bibliographic citations but also third-party involvement with university activities. Surveys are unsuitable for global rankings because there is no single individual with comprehensive, multi-institutional, and multidisciplinary experience across continents.

Research output is also a key topic for Webometrics, but it includes not only formal (e-journals, repositories) publications but also informal scholarly communication. Web publication is cheaper while maintaining high standards of peer review, and it can reach much larger audiences, providing access to scientific knowledge for researchers in developing countries and local stakeholders (economic, industrial, political, or cultural).

All institutions with an independent web domain and 24/7 operating servers can be included. We take care to exclude fake institutions such as diploma mills or non-accredited institutions. Our decisions regarding non-inclusion are final, and we do not engage in email exchanges about these issues. However, the absence of an institution may result from an error, and if you notice any mistakes, please contact us.

Following the Shanghai Ranking model, we developed a composite indicator, combining several indicators with a weighting system. Our scientific model follows a logical ratio between activity-related and impact-related variables. Values are normalized using natural logarithms to correct for the power law distribution of the data. After log-normalizing the variables, they are combined with a 1:1 ratio between activity/presence and visibility/impact indicators.

The current calculation of indicators is shown in the table below:

| INDICATORS | MEANING | CALCULATION | SOURCE | WEIGHT |
|------------|---------------------|---|----------|--------|
| VISIBILITY | Web contents impact | Number of external inlinks from different networks (subnets) to the main university domain (January 2026) | MAJESTIC | 50% |
| EXCELLENCE | Top cited papers | Number of top 10% cited papers for each one of the 27 disciplines in the period 2020-2024 | SCIMAGO | 40% |
| OPENNESS | Total citations | Number of citations for the period 2021-2025 of institutions with RoR identifier | OPENALEX | 10% |

Please, register free-of-charge your institution at the institutional identifier database RoR (<https://ror.org>)

Comments

There is no classification of different institutional types, so research-intensive universities are ranked alongside community colleges or theological seminaries. However, the rank segregates them, making it easy to build sub-rankings for those interested.

Direct measurement of the teaching mission is virtually impossible, and evaluations based on surveys (which are subjective), student-to-faculty ratios (often unreliable), or employment outcomes (which are influenced by many variables beyond teaching quality) should be avoided. Webometrics indirectly ranks this mission by using web presence as an indicator of scholars' commitment to their students. Although it is not perfect, the future of this mission is clearly tied to the web, and any institution or individual not recognizing this is losing ground quickly.

The quality of data depends not only on the sources used but also on the numbers involved. For example, the number of universities with more than one Nobel Prize is likely fewer than 200, making it difficult to rank them accurately. Similarly, citation data is limited by the number of citations, while link data offers much larger numbers, usually two or even three orders of magnitude larger. While web indicators are noisier, they are statistically better suited for uncovering patterns and distinguishing among a larger number of institutions.

Many institutions still have multiple web domains, maintaining old domains or using alternative domains for international content. Even universities with a single domain sometimes change it frequently without apparent reason. A common practice is switching to an ".edu" domain (which usually refers to U.S. universities) even when the country has a clearly defined academic subdomain (e.g., edu.pl, edu.ua, ac.kr). These domain changes severely penalize universities in the Webometrics ranking and reduce their web visibility. While this may not significantly affect local populations, it confuses global audiences and third parties.

If a university has two or more central web domains, only the domain of the homepage is ranked. If both are used as the homepage, the one with the better web indicators will be published.

Notes

- (1) Multiple domains penalize rankings and visibility. We suggest discontinuing all alternative domains, especially if they are no longer in use, for the benefit of the institution's ranking.

- (3) Faculties, schools, or departments with separate domains from the university's central one should aim to consolidate under one domain for better visibility.
- (4) Universities providing only online distance learning (including Caribbean medical schools) should be carefully checked for accreditation status.
